Light quality and optics

Superiour colour rendition

With colour rendering indexes R_a above 95 and R_9 (red) above 90 the surgeon recognizes clearly the tiniest nuances of colour in tissue.
The colour rendering index is $R_a \geq 95$. For recognizing the exact colour spectrum of the wound the exact rendition of the red colour range is essential. R_9(red) ≥ 90 means for the surgeon a visibly better recognition of details. The colour spectrum of the wound is rendered naturally with rich contrast. The OT-light clearly provides welcome relief for your eyes.

Facetted multi-lens system

A multitude of computer-calculated facetted lenses guarantees homogeneity and lowest shadiness in the light field.
Separately arranged optical systems, with one LED module, generate their own light field, which increases the contrast effect of the OT-light. Light intensities of 130.000 Lux can be attained without difficulty.

Focussing (optional)

The light field can be focused by turning the handle.
The focussable light beam allows a punctual illumination of deepest wound channels with light intensity and an exact matching of the light field diameter with the size of the wound field.

Additional comfort

Cool light

The LED technology is much more effective than conventional light sources such as halogen bulbs. The heat radiation is reduced to a minimum without using any expensive filter technique. The temperature increase in the surgeon's head area is almost nonexistent.

Flow properties

During development high attention was paid to the performance of the new LED OT-lights in laminar-flow ceiling systems.
